Office Action Summary

Application No.

09/765,108

Applicant(s)

MEDVINSKY, ALEXANDER

Examiner

Carl Colin

Art Unit

2136

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 17 February 2006.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-7 and 10-23 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-7 and 10-23 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 16 January 2001 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- 11) ☐ The proposed drawing correction filed on _____ is: a) ☐ approved b) ☐ disapproved by the Examiner.
- If approved, corrected drawings are required in reply to this Office action.
- 12) ☐ The oath or declaration is objected to by the Examiner.

Priority under 35 U.S.C. §§ 119 and 120

- 13) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.
- 14) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application).
- a) ☐ The translation of the foreign language provisional application has been received.
- 15) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO-1449) Paper No(s) _____.
- 4) ☐ Interview Summary (PTO-413) Paper No(s). _____.
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: _____.

DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 7/29/2005 has been entered.

Response to Arguments

1.1 In response to communications filed on 2/17/06, applicant has amended claims 1, 2, 6, 10, 11, 12, 13, 15, 16, 18, and 19-22. The following claims 1-7 and 10-23 are presented for examination.

In response to communications filed on 2/17/06, the claim objection and the 112 rejection has been withdrawn with respect to the amendment. However, it appears that claims 1, 17, and 19 as amended raise the issue of new matter.

Applicant's arguments, pages 12-17, filed on 7/29/2005, with respect to the rejection of claims 1-7 and 10-23 have been fully considered but they are not persuasive. Applicant argues that Klingler fails to disclose "generate a second key stream when a component used to transmit the Real Time Protocol voice packets changes during the communication session and the packet encryptor and packet decryptor use the second key" because the generation of key of Klingler is merely associated with making new connection. Examiner respectfully disagrees. The

Art Unit: 2136

embodiment that Applicant relies on in Klingler for making this statement is “an embodiment of encryption for an originating call or a call in which an RU establishes a connection with a base station. However, as mentioned previously by Examiner in the advisory Action, paragraph 101 clearly discusses “generating a second key stream when a component used to transmit the Real Time Protocol voice packets changes during the communication session”. Applicant has amended the claims to add that changes take place during communication session. However, the specification does not specify that the change takes place “during communication session”, in one embodiment, however, when a new session restarts a new key is derived (page 7, lines 28-33). With respect to Applicant's general allegation about the priority date of the references about what is not disclosed in the provisional application, the scope of the invention of Klingler is supported in the provisional application and the citations provided by the Examiner are fully supported with respect to one of ordinary skill in the art as mentioned previously in the Advisory action. Applicant needs to specify which citation, examiner is relying upon that is not supported by the provisional action. Upon further consideration, applicant has not overcome the prior art and the rejection of claims 1-7 and 10-23 is set forth below.

Claim Objections

2. Claims 11, 12, 15, 16, 18, and 21-22 are objected because the “--” mark previously in the claims before the amendment should be replaced for instance by a comma or any other appropriate correction to avoid changing the scope of the limitation of the claims. As amended the shared secret may contain other values besides a random value. Appropriate correction is required.

Claim Rejections - 35 USC § 112

3. The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

3.1 Claims 1, 17, and 19 and the intervening claims are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim contains subject matter, which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention. Applicant's disclosure fails to recite whether the generating of a new key or the changing of the component occurs during the communication session. Applicant is requested to clearly point out by page and line numbers for each of these independent claims as amended where the specification describes the claim limitations as amended. The specification, on the other hand, describes when a new session restarts a new key is derived (page 7, lines 28-33).

Claim Rejections - 35 USC § 103

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4.1 **Claims 1-3, 6-7, 10-16, and 19-23** are rejected under 35 U.S.C. 103(a) as being unpatentable over US Patent Publication US 2003/0003896 to **Klingler et al** in view of US Patent 5,081,679 to **Dent**.

4.2 **As per claims 1 and 19, Klingler et al.** discloses a system for securely transmitting Real Time Protocol voice packets during a communication session with a remote multimedia terminal adapter over an Internet protocol network; the system comprising: Klinger discloses in one embodiment a system comprising remote units and base stations for sending/receiving messages, messages include control data and payload data wherein the control data contains a particular control message used to initiate an encryption synchronization process including triggering a synchronization counter with a size of a message that allows determining when the last block of the message has been transmitted as the counter decrements to zero then initializing the cryptosystem (page 9, claims 8-10 and pages 1-2, paragraph 0026) that meets the recitation of a local multimedia terminal adapter receiving the voice packets having a timestamp as a synchronization source to synchronize cryptographic operations between said local multimedia

terminal adapter and said remote multimedia terminal adapter, the local multimedia terminal adapter comprising, a local key stream generator for generating a first key stream, for example (see page 3, paragraphs 0038-0041 and page 7, paragraphs 0093-0094); a packet encryptor that encrypts the voice packets using at least a portion of the first key stream to form encrypted voice packets, forwarding the encrypted voice packets from the local location to the remote location for example (see page 3, paragraphs 0038-0041 and page 7, paragraphs 0093-0094); the remote multimedia terminal adapter receiving the encrypted voice packets, the remote multimedia terminal adapters further comprising, a remote key stream generator for generating the first key stream in order to decrypt the encrypted voice packets, for example (see page 3, paragraphs 0039-0041; page 2, paragraphs 0027, 0032, 0033); and a packet decryptor decrypting the encrypted voice packets using the first key stream, for example (see page 3, paragraphs 0039-0041; page 2, paragraphs 0027, 0032, 0033), wherein both key stream generators are capable of generating a second key stream when a component used to transmit the Real Time Protocol voice packets changes during the communication session and the packet encryptor and packet decryptor use the second key stream, for example (see page 8, paragraph 0101). The “timestamp” disclosed by Klingler such as encryption synch counter, and encryption switch, and additional algorithm for synchronization of cryptographic operations reads on the claimed invention. To provide further support of some of well known features, **Dent** in an analogous art teaches a encryption/decryption system for bit synchronization using a timeout parameter and counter as a basis to generate new key and further discloses changing the parameter to fit individual circumstances, for example (see column 15, lines 20-50). **Dent** also discloses using real-time clock and counters because it is important for the receiver to be operated in

synchronism with the transmitter key stream generator for the message to be properly decoded (column 12, lines 23-51). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the method and system of **Klingler et al** to provide timestamp synchronization source to synchronize cryptographic operations between said local multimedia terminal adapter and said remote multimedia terminal adapter as taught by **Dent**. This modification would have been obvious because one skilled in the art would have been motivated by the suggestions provided by **Dent** so as to enable the receiver to be operated in synchronism with the transmitter key stream generator for the message to be properly decoded (column 12, lines 23-51).

As per claims 2 and 20, Klingler et al. discloses the limitation of wherein the second key stream is generated when the system switches from a first to a second coder/decoder for compression/decompression of the voice packets, for example (see page 8, paragraphs 0100-0101 and page 10, claims 18-21).

As per claim 3, Klingler et al. discloses the limitation of wherein the second key stream is generated when a Message Authentication Code algorithm change occurs, for example (see page 6, paragraphs 0086-0089; pages 1-2, paragraph 0026 and page 10, claims 18-21).

As per claim 6, Klingler et al. discloses a system for communicating Real Time Protocol voice packets between a local and a remote location over an Internet protocol network, the system comprising: a stream cipher module for encrypting the voice packets, for example

(see page 3, paragraphs 0038-0041 and page 7, paragraphs 0093-0094); and a key stream generator for generating a first Real Time Protocol key stream, the stream cipher module employing the first key stream to encrypt the voice packets for forwarding to the remote location, the key stream generator producing a second Real Time Protocol key stream for encrypting the voice packets when the system switches from a first communication parameter to a second communication parameter, each of the first and second parameters being involved in the synchronization of the key stream, for example (see pages 6-7, paragraphs 0086-0090; page 8, paragraphs 0101-0103 and page 10, claims 18-21, 33 and abstract). Klinger discloses voice messages that include control data and payload data wherein the control data contains a particular control message used to initiate an encryption synchronization process including triggering a synchronization counter with a size of a message that allows determining when the last block of the message has been transmitted as the counter decrements to zero then initializing the cryptosystem (page 9, claims 8-10 and pages 1-2, paragraph 0026) that meets the recitation of wherein the voice packets having a timestamp as a synchronization source to synchronize cryptographic operations between said local multimedia terminal adapter and said remote multimedia terminal adapter. The “timestamp” disclosed by Klinger such as encryption synch counter, and encryption switch, and additional algorithm for synchronization of cryptographic operations reads on the claimed invention. To provide further support of some of well known features, **Dent** in an analogous art teaches a encryption/decryption system for bit synchronization using timeout parameter and counter as a basis to generate new key and further discloses changing the parameter to fit individual circumstances, for example (see column 15, lines 20-50). **Dent** also discloses using real-time clock and counters because it is important for the receiver to

Art Unit: 2136

be operated in synchronism with the transmitter keystream generator for the message to be properly decoded (column 12, lines 23-51). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the method and system of **Klingler et al** to provide timestamp synchronization source to synchronize cryptographic operations between said local multimedia terminal adapter and said remote multimedia terminal adapter as taught by **Dent**. This modification would have been obvious because one skilled in the art would have been motivated by the suggestions provided by **Dent** so as to enable the receiver to be operated in synchronism with the transmitter keystream generator for the message to be properly decoded (column 12, lines 23-51).

As per claim 7, Klingler et al. discloses the limitation of wherein the first communication parameter is a first coder/decoder that compresses/decompresses the voice packets, and the second communication parameter is a second coder/decoder that compresses/decompresses the voice packets, for example (see page 2, paragraph 0032).

As per claim 10, Klingler et al. discloses the limitation of further comprising a new time stamp sequence generated when the second Real Time Protocol key stream is generated, for example (see page 7, paragraphs 0093-0094).

As per claim 23, Klingler et al. discloses the limitation of further comprising a synchronization source for synchronizing and enabling decryption of the voice packets at the remote location, for example (see pages 1-2, paragraph 0026).

As per claim 13, Klingler et al. discloses a method for securely transmitting Real Time Protocol voice packets from a local to a remote location via a communication network, the method comprising: generating a first Real Time Protocol key stream for encrypting the voice packets; forwarding encrypted voice packets to the remote location, for example (see page 3, paragraphs 0038-0041 and page 7, paragraphs 0093-0094); generating a second Real Time Protocol key stream for encrypting the voice packets in response to a request to change communication parameters for the same media stream, for example (see pages 6-7, paragraphs 0086-0094; page 8, paragraphs 0101-0103 and page 10, claims 18-21, 33 and abstract); and forwarding voice packets encrypted with the second Real Time Protocol key stream to the remote location, for example (see page 8, paragraphs 0101-0103). Klingler discloses voice messages that include control data and payload data wherein the control data contains a particular control message used to initiate an encryption synchronization process including triggering a synchronization counter with a size of a message that allows determining when the last block of the message has been transmitted as the counter decrements to zero then initializing the cryptosystem (page 9, claims 8-10 and pages 1-2, paragraph 0026) that meets the recitation of wherein the voice packets having a timestamp as a synchronization source to synchronize cryptographic operations between said local multimedia terminal adapter and said remote multimedia terminal adapter. **Dent** in an analogous art teaches a system for bit synchronization using a timeout parameter a handoff counter as a basis to generate new key and further discloses changing the parameter to fit individual circumstances, for example (see column 15, lines 20-50). **Dent** also discloses using real-time and counters because it is important for the receiver to be

Art Unit: 2136

operated in synchronism with the transmitter keystream generator for the message to be properly decoded (column 12, lines 23-51). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the method and system of **Klingler et al** to provide timestamp synchronization source to synchronize cryptographic operations between said local multimedia terminal adapter and said remote multimedia terminal adapter as taught by **Dent**. This modification would have been obvious because one skilled in the art would have been motivated by the suggestions provided by **Dent** so as to enable the receiver to be operated in synchronism with the transmitter keystream generator for the message to be properly decoded (column 12, lines 23-51).

As per claim 14, Klingler et al. discloses the limitation of further comprising reinitializing a time stamp for synchronizing decryption of the voice packets, for example (see pages 1-2, paragraph 0026).

As per claims 11, 15, and 21, Klingler et al. discloses the limitation of providing key derivation or a pseudorandom function based on a counter, and shared secret key, for example (see page 7, paragraph 0089, 0094; page 8, paragraphs 0101-0105) that meets the recitation of wherein the second key stream is generated by re-executing the following key derivation function: $F(S, \text{"End-End RTP Key Change } \langle N \rangle")$ where N is a counter incremented whenever a new set of Real Time Protocol keys is re-derived for the same media stream session; $F()$ is a one-way pseudo-random function used for the purpose of key derivation; S is a shared secret - a random value shared between the two endpoints and is known only to those two endpoints or a

Art Unit: 2136

trusted server, and "End-End RTP Key Change <N>" is a label that is used as a parameter to the key derivation function $F()$, <N> stands for an ASCII representation of a decimal number, representing a counter. **Klingler et al.** discloses the same result and also discloses algorithm for key generation in pages 4-5. Similar algorithm in the claimed invention of f as a function of a secret key and a parameter can be found in cryptography textbook known in the art, which does not depart from the spirit and scope of the invention disclosed by **Klingler et al.** **Dent** in an analogous art teaches a system for bit synchronization using a timeout parameter a handoff counter as a basis to generate new key and further discloses changing the parameter to fit individual circumstances, for example (see column 15, lines 20-50). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the method and system of **Klingler et al** to provide a key generation as a function of a secret key and a counter as taught by **Dent**. This modification would have been obvious because one skilled in the art would have been motivated by the suggestions provided by **Dent** so as to selectively change the parameter to fit individual circumstances.

Claims 12, 16, and 22 are similar to the rejected **claims 11, 15, and 21** except for adding a source identifier, which is known in the art as found in US patents 6,2754,71 and 6,122,665. **Klingler et al.** also uses an identifier to identify the source of the message, for example (see page 2, paragraph 0032). Therefore, **claims 12, 16, and 22** are rejected on the same rationale as the rejection as the rejection of **claims 11, 15, and 21**.

Art Unit: 2136

5. **Claims 4 and 5** are rejected under 35 U.S.C. 103(a) as being unpatentable over US Patent Publication US 2003/0003896 to **Klingler et al** in view of US Patent 5,081,679 to **Dent** as applied to claim 1 above and further in view of US Patent Publication US 2002/0031126 to **Crichton et al.**

5.1 **As per claims 4 and 5, Klingler et al.** substantially teaches forwarding/receiving encrypted packets from a local to a remote end, for example (see page 10, claims 18-21). **Klingler et al.** does not explicitly teach using a gateway controller, which is well known in the art of Internet Protocol network for connecting different protocol networks. However, **Crichton et al.** in an analogous art teaches a system for bit synchronous network communications over packet networks including Internet protocol network using gateways in an end-to-end communication path to perform analog to digital conversion and to communicate with packet network in a manner known in the art, for example (see page 5, paragraphs 0042 and 0047; see also background). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the method as combined above to provide a gateway controller as taught by **Crichton et al.** for forwarding and receiving encrypted packets through an Internet protocol to perform analog to digital conversion and to communicate with packet network in a manner known in the art. This modification would have been obvious because one skilled in the art would have been motivated by the suggestions provided by **Crichton et al.** so as to perform analog to digital conversion and to communicate with packet network in a manner known in the art.

6. **Claims 17 and 18** are rejected under 35 U.S.C. 103(a) as being unpatentable over US Patent Publication US 2003/0003896 to **Klingler et al.** in view of US Patent Publication US 2002/0031126 to **Crichton et al.** and in view of US Patent 5,081,679 to **Dent**.

6.1 **Claim 17** contains some of the limitations of claims 6 and 13 except for sending encrypted data to a gateway, which was discussed in claims 4 and 5 above. Claim 17 also adds generating a second Real Time Protocol key stream for encrypting the voice packets in response to a collision detection wherein the multimedia terminal adapters have the same source identifier. **Klingler et al** discloses using exiting command and control messages in a data stream for automatic synchronization if the data path has been compromised and a new connection established, and new key needs to be generated upon resynchronization. Although **Klingler et al** does not specify collision as an example for resynchronization, it does not depart from the spirit and scope of the invention disclosed by Klingler; it is obvious to one of ordinary skill in the art that collision is one of the reasons of starting new session that requires resynchronization, this is a well known feature as explained, for instance in RFC 1189. Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify Klingler et al to regenerate new key upon restarting a new session including in response to collision because if a new key is not generated upon resynchronization the system would be compromised for attack as suggested by Klingler et al (page 8, paragraph 101). Klingler also quotes, “the process of synchronization must give an attacker no specific knowledge of the key at any time” (provisional application). **Dent** discloses the generation of new key when there is no

Art Unit: 2136

synchronization, as discussed in claims 11, 15, and 21. Therefore claim 17 is rejected on the same rationale as the rejection of claims 4-6 and rejection of claims 11, 15, and 21.

Claim 18 is similar to the rejected **claims 12, 16, and 22**. Therefore, **claim 18** is rejected on the same rationale as the rejection of **claims 12, 16, and 22**.

Conclusion

7. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Carl Colin whose telephone number is 571-272-3862. The examiner can normally be reached on Monday through Thursday, 8:00-6:30 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Ayaz Sheikh can be reached on 571-272-3795. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only.
